THE RACE

A simpler weekly update

Workflow v2 · approved by Patrick

2026-11-10

Fewer decisions, the same evidence

7 tasks → 4 visible phases

- Remove the weekly email task entirely.
- Keep acquisition and validation with **GPT**.
- Keep dashboard publication and live checks with **Claude**.
- Target **two routine approval decisions**, with one explicit Claude handoff.

Approved for new runs · notification activation follows a successful pilot.

One process, clear ownership

Phase	Owner	Verified outcome	Weight
1 · Collect	GPT	Complete source bundle and bounded Sheet update	35%
2 · Validate & review	GPT + Patrick	Source checks pass; exact release approved	30%
3 · Release & hand over	GPT	Six-file GitHub release and Claude brief	10%
4 · Publish & verify	Claude	Correct dashboard served live	25%

Alongside Race: weekly Elo + yElo checks and manually supplied UTR.

Before phase 1: a lightweight readiness watch; no automatic writes.

Sunday readiness: check the relevant results

READ-ONLY WATCH

1. Resolve the **30-player roster** and relevant weekly events.
2. Confirm the players’ final completed rounds or tournament finals.
3. Check that TA’s displayed **Serve and Return** views agree.
4. Retain pending matches and publication gaps in a small watchlist.

A major-tour final is insufficient if relevant Challenger, qualifying, ITF or team-event results are still outstanding.

Notify once when approval is useful

Approved schedule · America/New_York

Sunday **18:00 → 21:00** · Monday **00:30 → 08:30**

- Stop checking once the week has one readiness notice.
- Sunday readiness permits a **provisional start**, not final release.
- Monday cutoff reconciliation and dated TE reports remain required.
- If still incomplete Monday, give one exception summary.

---

iPhone delivery must pass the pilot before schedules are activated.

Approval 1: start the weekly update

“Start this week’s update”

The approval covers a concrete **standard update profile**:

- named week, cutoff, roster and scoring rules;
- source acquisition, verified backup and bounded routine Sheet writes;
- source validation, a frozen candidate and its review packet.

New roster rules, history repairs and expanded public scope still pause.

Phase 1 · Collect with GPT

Acquire only what changed. Validate the whole required scope.

- Reuse verified captures whose full dependencies are unchanged.
- Recapture affected players and outstanding results.
- Parse the required TE pages once; resolve all **60 ranking joins**.
- Batch independent reads; stage exact changes and back up before writes.

Week-38 reference: 60 TA views · 27 TE pages · 30 active selections

Phase 2 · Validate and review once

DETERMINISTIC CHECKS FIRST · MODEL REVIEW FOR EXCEPTIONS

- Source equality, missing/extra/duplicate rows and native types.
- Transfer guards, +5 duels and all five team totals.
- Historical protection, formula ranges and source-date coverage.
- All exported fields, six schemas and explicit null meanings.

Approval 2: Patrick approves one exact, frozen release summary.

Phase 3 · Release and hand over

hebdo · joueurs · players · matches · calendar · team_colors

1. Commit one coherent, data-only release on a dedicated branch.
2. Read back all six hashes from the immutable commit.
3. Generate Claude’s short brief from the same manifest.
4. Patrick passes that brief to Claude.

Preserve schema, transfer lineage and unrelated repository work.

Phase 4 · Claude publishes and verifies

ONE DATA RELEASE · ONE PRODUCTION OWNER

- Read current HEAD and the approved six-file hashes.
- Incorporate the release; run the existing dashboard builder.
- Publish without unrelated redesign or tutorial regeneration.
- Verify served hashes, version, week, totals, filters and mobile layout.

100% means the correct release is live—not merely committed or built.

A single progress view

ILLUSTRATIVE STATE · WAITING FOR RELEASE APPROVAL

60% verified

Collect ✓ | Validate 5/6 | Release ○ | Live ○

Show the current phase, verified units, source freshness, next action and **who is needed**. Display pauses separately from progress.

Reduce repeated model work

Today’s repeated work	Proposed replacement
Long histories reread in every conversation	Immutable source artifacts + dependency hashes
Ad hoc parsing and reconciliation	Reusable, tested deterministic scripts
Reconstructed handoff narratives	Short manifest-generated Claude brief
Full-roster recapture after a small source change	Changed-player capture + complete validation
Weekly Gmail preparation and readback	Removed from the workflow

Measure savings: model calls, tokens, source requests and retries per run.

Frozen releases separate data from live imports

A transient LIVE error is an operational warning

After release approval, the authoritative inputs are the **frozen source bundle, dated snapshot and release manifest**.

- A failing volatile import does not rewrite published history.
- A changed frozen value, rule or released file does require a revision.
- Repair LIVE separately, with its own bounded authorization and evidence.

Build toward two iPhone experiences

Patrick · owner view

Readiness notice, start approval, progress, exceptions and release approval.

Private authenticated actions.

Friends · companion view

Current standings, players, history, source dates and last verified update.

Public read-only dashboard data.

Begin with an installable web app. Keep the same run and approval contracts if a native Apple app is added later.

Approved design and rollout

Approved design

- Four phases, two routine decisions and explicit Claude handoff.
- The standard write profile and immutable release boundary.
- Sunday/Monday check times and one actionable notification per week.
- Progress contract and future owner/public app separation.

After approval: version the skills and guidelines, test notification delivery, activate schedules, then run one monitored week before wider rollout.
